Manage Resources

What is the **coolest** thing about a Virtual Private Server? Is it the unique IP? Is it the stability provided by isolation from other users? OR.... is it the ability to scale the resources available to you whenever you want, **in real time?**

Clearly, it is the latter.

You've come to the right place to make those changes!

The graphs below provide you a guide to decide what memory settings would be best for you. Your goal is to keep the "load" as low as possible.. the higher that load, the slower your site. Besides making your site more efficient, the only way to really drop the load on your server is to **RAISE** your resources using the slider below!

So go for it!

ps110770 (on homie-vserver309)

Adjust Resources:

Currently *ps110770* is guaranteed **2289 MB** for **$114.45/month.**

Slide to change your allocations:

[=========================|===================]   Guaranteed [744] **MB** for
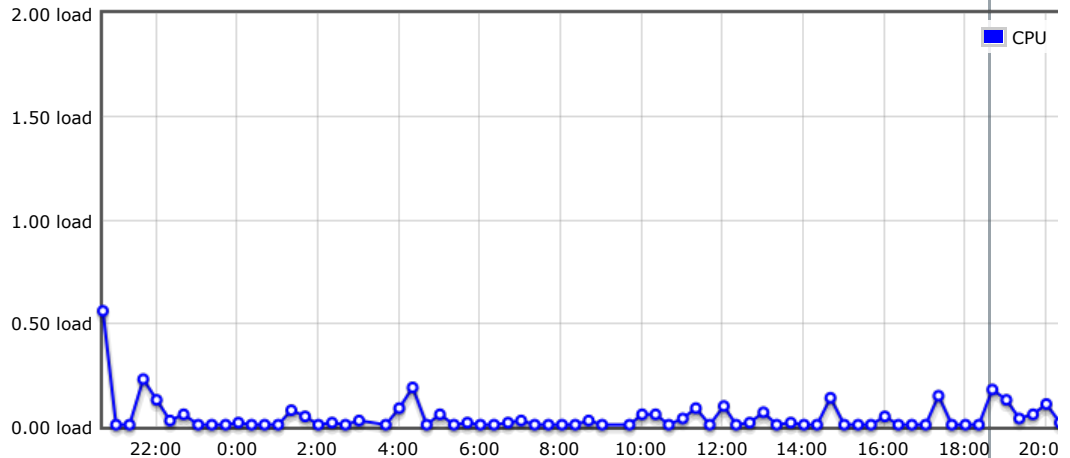

$114.45/month.

[**Change ps110770's resources now!**]

☐FORCE a resize even if *ps110770* is using more than 2289MB of memory! (May require us to reboot *ps110770*).

Last Day / Last Month Graphs:

The blue line is *ps110770's* 5 minute "load" average.
The yellow line is memory used by your disk cache ("cached memory").
The red line is memory used by the resident set size (memory held in RAM).
The orange line is total memory used (the sum of the yellow and red line).
